

Over the past decade, Bitbrains has delivered high performance IT solutions to its clients through effective combinations of smart engineering and cutting-edge technology. The company specializes in using cloud platforms and high-performance computing to maximize the performance of existing IT systems -- in its words, "we turn your go-cart into a race car, and make sure it performs under the strictest rules of road safety." Consequently, Bitbrains sought out Tenable to help it fulfill its security promise to its customers.

Key Business Needs

Bitbrains faced a technical challenge from its customers, who required more frequent network monitoring for vulnerabilities and compliance issues, as well as expedited results.

Tenable Products Selected

Bitbrains selected SecurityCenter Continuous View™, which provides a continuous monitoring platform that enables a comprehensive and integrated view of network health across all assets.

Resulting Benefits

Tenable delivered a significant savings in both time and capabilities. With SecurityCenter CV in place, it now takes only 24 hours to scan external-facing sites, rather than an entire week. As a result, Bitbrains can quickly identify the biggest risks across the enterprise, as well as the solutions available to resolve them.
